OVER ONE HUNDRED YEARS

OF INDUSTRIAL
ENGINEERING
FROM BARI TO EUROPE

20
22

Cestaro Rossi & C. S.p.A. is an Italian Company engaged in Erection and Maintenance of Mechanical and Electrical-instrumental Plants for Oil Refineries, Nuclear Plants, Power and Industrial Plants. Cestaro Rossi & C. S.p.A. embodies all the experience acquired by operating in different industrial settings, both in the field of maintenance and in the field of advanced plants erection.

CUSTOMIZED AND FLEXIBLE SERVICE

- Planning and performing single mechanical and/or electro-instrumental works;
- Planning and performing commissioned works, coordinating other contractors activity as the main contractor;
- Planning and turnkey performance of all contracted works required;
- Integrated GLOBAL SERVICE.

Cestaro Rossi & C. S.p.A., established in Bari in 1921, is a leader in the Prefabrication, Erection and Mechanical Maintenance (Turnaround) of Oil Refinery, Petrochemical Plants as well as Power Plants and Industrial Plants. Field of activity: Piping prefabrication and erection (carbon steel, AISI and alloy steel), Steel structures prefabrication and erection, Mechanical equipment installation, Equipment maintenance.

The Electrical Division of the Company is leader in the Electrical/Instrumental installations and maintenance for MV and LV Systems, including Explosion-proof electrical installations, Electrical Panels and Instrumental Calibration/Installation/Maintenance for Oil Refinery, Power and Industrial Plants.

CUSTOMER SATISFACTION

FIELD OF ACTIVITY

The dynamic managerial and operational adjustment makes the Group today increasingly complete and competitive in the sector of construction and maintenance of industrial plants.

FIELD OF ACTIVITY

GLOBAL SERVICE MECHANICAL, ELECTRICAL/INSTRUMENTATION, TECHNOLOGICAL AND CIVIL CONSTRUCTION

- Oil Refineries
- Nuclear Plants
- Petrochemical Plants
- Pharmaceutical Plants
- Power Plants
- Industrial Plants
- Industrial Buildings
- Business centers
- Petrol Stations
- Photovoltaic Plants
- Tertiary
- Biomass Power Plants

MECHANICAL AND ELECTRICAL PREFABRICATION

- Scheduling and coordinating of the Activities
- Structural steel
- Piping (carbon steel, stainless steel, alloy steel, special steel)
- Low Voltage Panels
- Electrical-instrumental Panels
- Technological Plants

SKID PRODUCTION PLANT MODULARIZATION

- Designing starting from the Customer data
- Material Procurement
- Prefabrication and installation of:
 - Steel frame
 - Piping
 - Valves
 - Instruments with primary connection piping, JB and cabling
- NDT
- Testing
- Allround transport
- On-site Installation (mec/ele/instr.)
- Commissioning Assistance

ERECTION AND NEW CONSTRUCTION MECHANICAL AND ELECTRICAL INSTRUMENTATION PLANTS

- Scheduling and coordinating Activities
- Structural steel Erection
- Piping Erection (carbon steel, stainless steel, alloy steel, special steel)
- Equipments Erection
- Tanks Erection
- Water Treatment Plants Erection
- HV/MV/LV Electrical Plants Erection, also in hazardous areas (explosion area)
- Instrumental Plants Erection, including instrumentation setting
- LV/MV Panel Erection
- Photovoltaic Plant Erection
- HV/MV/LV Electrical Substations Erection
- HVAC Plants Erection

ROUTINE MAINTENANCE
MECHANICAL
AND ELECTRICAL
INSTRUMENTATION PLANTS

- Scheduling and coordinating activities
- Piping Maintenance (carbon steel, stainless steel, alloy steel, special steel)
- Equipment Maintenance
- Tanks Maintenance
- Water Treatment Plants Maintenance
- HV/MV/LV Electrical Plants Maintenance, also in hazardous areas (explosion area)
- Instrumental Plants Maintenance, including instrumental setting
- LV/MV Panel Maintenance
- Photovoltaic Plant Maintenance
- HV/MV/LV Electrical Substations Maintenance
- HVAC Plants Maintenance
- HP Cleaning;
- HP Water Cutting

REFINERY/POWER
PLANTS/PETROCHEMICAL
TURNAROUND
MECHANICAL AND
ELECTRICAL/INSTRUMENTATION
PROCESS PLANTS

- Activities scheduling and coordination
- Piping construction and installation/replacement
- Fittings and valves overhauling
- Equipment maintenance (exch., vessels, columns, air-coolers etc)
- Electrical Plants Maintenance
- Instruments Maintenance
- Equipments hp water cleaning
- Bundles replacement
- Furnaces maintenance and overhauling
- Boilers maintenance and overhauling
- Equipment overhauling and replacement internal parts
- Equipment overhauling with partial replacement of shell and/or top

PHOTOVOLTAIC / BIOMASS POWER PLANTS

- Due diligence and Authorizations
- Plant Designing
- Material Purchasing
- Plant Construction (civil works, Mechanical and Electrical installation)
- Plant Start-up
- Routine Maintenance

OFF-SHORE MECHANICAL MAINTENANCE

- Piping Maintenance (carbon steel, stainless steel, alloy steel, special steel)
- Equipment Maintenance

PATROL STATION

- Plant Designing
- Demolition of existing plants
- Plant Construction (civil works, Mechanical and Electrical installation)
- Plant Start-up
- Routine Maintenance
- Plant Rebuilding

**CIVIL
WORKS**

- Contracts and authorization
- Preliminary, final and in detailed design
- Concrete works performance
- Testing

**SELF-DESIGNING AND
CONSTRUCTION OF SPECIAL
EQUIPMENT WORKING**

- Bundle Extractor
- Bundle Transporter

**MECHANICAL
AND ELECTRICAL
DESIGNING**

- Mechanical Steel Designing
- MV/LV Electrical Designing

SUSTAINABILITY

Our commitment in
environmental
sustainability

SUSTAINABILITY

Our Company commitment in environmental sustainability started in 2019, in compliance with the global guidelines set out by the Paris Agreements and oriented to the abatement of greenhouse emissions, to reduce the use and disposal of plastics and more in general, with a view to any other aspect that can improve the environmental situation of the planet.

ZERO ENVIRONMENTAL IMPACT

In 2019 the first electric JMG cranes were purchased, with full remote operation and zero environmental impact. Their reduced dimensions and very small turning circle allow working in tight spaces and enclosed environments emission free, safeguarding operators' health and safety. A winning feature constantly and increasingly pursued by the company.

In 2020 the company started an upgrading path for the lifting equipment, increasing the vehicle fleet with the first new generation LIEBHERR mobile crane, equipped with sensors and innovative electronic and software solutions. A choice that perfectly places our company in the framework of Industry 4.0: the new industrial process in which we are actively moving.

The cranes are equipped with a single engine (the previous models used two engines instead) which can operate both the crane carriage and tower, allowing fuel consumption reduction. Very high efficiency is guaranteed by the connection to a cardan shaft that keeps low engine speed while providing enough power to operate the tower, optimizing fuel consumption as a consequence. Maintenance costs and the crane weight are reduced thanks to the single engine used. The weight reduction then, allows the use of material in other structural elements and therefore increases the bearing capacity.

NEW LOW ENVIRONMENTAL IMPACT LIEBHERR MOBILE CRANE

GRU ELETTRICA
A COMANDO
REMOTO

The additional ECOmode program furtherly reduces consumption: the pumps traction with the engine at idle can switch off automatically and an intelligent control can switch it back on in few seconds, when required.

In the same year, the company established a task force dedicated to the central focus of sustainability, aimed at achieving the goal of 'sustainable provider' and meet the needs and requests of clients thereto related.

In addition, the first plastic free initiatives were implemented, with the target of eliminating the purchase and consequent accumulation and disposal of single-use plastic waste such as cups, coffee stirrers, and water bottles.

In 2021, more LIEBHERR mobile cranes and electric JMG cranes were purchased to keep working more efficiently, without neglecting the environmental impact.

With a view to pursue the target of becoming a sustainable company and according to our clients' requirements, we have acted promptly filling in questionnaires and surveys on the main dedicated web-portals:

- OPEN-ES FOR OUR CLIENT ENI
- ECOVADIS FOR OUR CLIENT ENGIE
- ECG CRIF FOR OUR CLIENT AEROPORTI DI ROMA

Liebherr new generation mobile crane equipped with sensors and cutting-edge electronic and It solutions which frame it within industry 4.0

HSEQ SYSTEM

Cestaro Management ensures its commitment in the fulfilment of a quality, safety and environment management system based on the principle of continuous improvement and formalized by the implementation of a quality/safety/environment system, a system certified according to UNI EN ISO 9001:2015, UNI EN ISO 14001:2015, ISO 45001 and MASE.

The aim of the Management is to improve results in accident prevention for workers, staff or temporary workforce and to guarantee safety for both equipment and clients' services.

This commitment results in the implementation of the following guidelines:

- **Conveying to the personnel our priority concerning the compliance with the safety conditions required by the client and with the regulations.**
- **Establishing a policy for safety, quality and environment targets.**
- **Organizing regular audits to check the system's effectiveness.**
- **Making available the resources required for the proper operation of the system.**
- **Informing the personnel about the framework, the performance and the person in charge of audits for all those activities affecting quality, safety and environment.**
- **Promoting improvement projects in the continuous search of new methods, solutions and products.**
- **Fostering feedback.**
- **Identifying support processes providing added value to the company.**
- **Creating a climate of confidence supporting the personnel involvement and development.**

The Company Management moreover commits to:

- Promote policy and targets to develop the personnel awareness, motivation and involvement
- Consider the continuous improvement as a target of the organization;
- Plan the future development of the organization;
- Take into consideration present and future needs of the client

Auditing the company's performance allows to check the achievement of strategical targets.

The company also ensures the disclosure of HSE instructions throughout the different levels and functions.

Transmitting information about safety, quality, environment, targets and results allows the involvement of the whole staff. Internal communication means could include meetings, safety notes, etc.

THE COMPANY GROUP

Headquarters
Workshops
Sites

THE COMPANY GROUP

TECHNICAL-ADMINISTRATIVE HEADQUARTERS

The head office, heart of the company, is in the center of Bari. It hosts about 35 technical/administrative employees and the Top Management. The following departments are centralized in the unit:

- **Top management**
- **Purchase office**
- **Commercial office**
- **Technical management**
- **Administrative management**

WORKSHOPS

The workshop in the industrial area of Bari is equipped to carry-out mechanical prefabrication works on pipes and steel structures as well as electric assembly works for panels, LV/MV electric Substations, remote-control, in a covered area of about 5000 sq. m. over a total area stretching over about 11000 sq.m

WORK SITES THROUGHOUT ITALY

The activities are carried out in various sites throughout in Italy. In particular:

■ BARI

Head Office and n. 3 workshop for the prefabrication of piping, steel structures and electric panels
Long Term Contract for Mechanical and electrical/instrumentation
Maintenance – Combined Cycle Power Plant 800 MW

■ TARANTO

Long Term Contract for Mechanical Maintenance Refinery ENI S.p.A.

■ LIVORNO

Long Term Contract for Mechanical and Electrical and I&C Maintenance Refinery ENI

■ MILAZZO

Long Term Contract for electrical/instr. Maintenance – Refinery RAM

■ PIOMBINO

Global Service Contract - Steel Factory Liberty (ex Arcelor Mittal).

■ ROSIGNANO

Long Term Contract for Mechanical and electrical/instrumentation
Maintenance at Engie Power Plant

■ TRECATE

Long Term Contract for Electrical/Instr. Maintenance- Refinery Exxon

■ SANNAZZARO

Long Term Contract for Mechanical and Electrical and I&C Maintenance- Refinery ENI

■ BRINDISI

Long Term Contract for Mechanical and Electrical and I&C Maintenance- in the Pharmaceutical
Plant Euroapi (ex Sanofi)

■ PRIOLO

Long Term Contract for Mechanical Maintenance in Versalis Plant

Furthermore, since 2017 we have been present at the Cadarache construction site in France for the ITER PROJECT, the construction of the new Nuclear Fusion Power Plant (the first in the world), for the performance of mechanical and electrical instrumental works.

- n. 2 Motor pumps for washing A.P. 100/2000 Bar
- n. 3 Hydrodynamic Machines
- n. 4 Vehicles with low-bed trailer
- 1.000 mq Box for offices, warehouses, changing rooms, canteens, toilets

MAIN CUSTOMERS

INNOVATION

After 100 years' activity,
the need is for
continuous renewal and
innovation.

A Company that now is 100-year-old needs continuous renewal and innovation, in order to anticipate the Market rather than chase it.

Innovation for us is a synonym for improvement and development of the key sectors, such as safety on site, service quality, acquisition of new markets and strengthening relations with our best Customers.

Our work experiences out of Italy in the last years have been a huge incentive to innovation; each project we carried out abroad gave us important starting points for development and improvement, for instance:

2014

Project "Turnaround of Grandpuits Total Refinery Plants (France) Distillation Unit".

The first real experience abroad tested our Company, on an important unit like the Topping, and convinced us about the usefulness of technological exchanges and confrontation on themes as safety and quality with the "foreign" Client, and the resulting positive outcomes for the company. Talking about more evident effects, we have realized how important it is to have the chance to count on our own means (for instance, the cranes that we subcontracted to local firms) for an increased flexibility and adaptability which only an internal team, can provide pushing us to a deep renovation of our number of machines in use.

2016

Project "Turnaround of Kalundborg Equinor Refinery Plants (Denmark)".

170 exchangers maintained in 5 weeks and "0 leakage on startup as a result. The torquing by hydraulic/torque wrenches and the ban to use sparkleor pneumatic wrenches were the reason of success. The experience pushed us to purchase new equipment and to certify our operators according to the regulation BS EN 1591. Another important starting point in the field of safety was the the Client requirement for workers to use a safety lanyard during the activities at height, to secure tools regardless of the work height the result was **"Zero Falling Object"** during the work.

2018

Project "Mechanic and Electric/Instrumental construction of BOP Plants for to the experimental Nuclear Fusion Plant ITER in Cadarache (France)".

This ongoing project, has put us through the tough challenge to manage procedures and documents about an experimental nuclear plant. We had then to rearrange on site staff tasks, raising its level. The high technological standards required by the Client pushed us to purchase more and more flexible suitable and safer machinery, for works enclosed environment. We also had to gear up with more accurate measuring equipment generally which largely benefiting from the ITER project, dealing with foreign countries for the first time in a such complex and technologically advanced environment.

2018

Project "Turnaround of Gunvor Refinery Plants in Rotterdam (Netherlands)".

The project allowed us to consolidate our experience in the use of hydraulic/pneumatic wrenches for all types of torquing. All our staff in charge of this activity was duly trained according the regulation BS EN 1591, by internal training including practical tests and final exams. Was another important experience: for 6 months the "Turnaround preparation": a team of three people worked for 6 months at the Turnaround preparation together with the refinery local team the software ROSER, which we normally used to validate the Client's data (performances expected, scaffoldings, spare parts, etc....) in the offer phase.

2019

Project "Normandy Refinery Plants Shutdown - France"

This ongoing project is helping consolidate our experience in TURNAROUND preparation, in terms of integration with the Client's team and usage of specific systems also in this case, a team has permanently been on site for 9 months integrating with the Refinery staff in order to carry on this delicate and decisive phase of the TAR.

2020

Project "Plants Shutdown Zeeland Refinery - Holland"

This project, managed in English language, helped consolidate our experience in TURNAROUND preparation, in terms of integration with the Client's team and usage of specific systems. Also in this case, a team worked for 12 months in Refinery, totally integrated with the Client's staff in order to carry on this delicate and decisive phase of the TAR. In addition, the TAR, carried out in the months of June and July 2020, took place in the midst of the Covid-19 pandemic. Compliance with stringent anti-Covid protocols allowed, also and above all thanks to a close collaboration between Refineries and Companies, to carry out the work in compliance with safety, timing and budget. A great result, achieved by very deep preparation and a stringent proactive controls.

Concerning the new refinery processes of TAR we used:

- the **ROSER** software in the preparation phase for the validation action times
- **Weld-it** software for welding activity during work preparation and performance
- **Blind-it** software for the management of blinding activity during the degassing/restarting phase of the battery limits and for equipment blinding.

2021

Project "TURNAROUND preparation Total Feyzin - France".

This project is the peak of all TAR preparation experiences performed so far. It is in fact, our "integrated" type preparation with Total. In the two months initial phase we will plan with the Client how to proceed with the preparation to be completed with the TAR works. A particular points-based pricelist (similar to standard man-hours) will be used to provide a quotation of the entire work to carry out.

In the **last 5 years we have invested about 4,5 M€** to "innovate" our Company. These investments have resulted in:

Purchase of new equipment, in particular:

A 180 and 230 tons cranes

They have completed our crane fleet, counting already over 18 cranes of different sizes. The new cranes, despite their dimensions are easily transportable (in fact they autonomously move on the road) and remote-controlled (so the crane operator can control the whole lifting area improving safety significantly. Add to this the huge advantage of using our own cranes, driven by our trained, trustworthy, flexible operators. All will improve the service offered safety and quality;

75, 90 and 120 tons cranes

Four new remote-controlled machines (much safer and more powerful);

Four electric 6, 9 and 10 tons cranes

Totally remote-controlled (no man on board).

These machines have increased the amount of our cranes. Moreover even difficult liftings in closed and very narrow spaces are now possible using nimbler equipment than that with an endothermic engine;

■ **20 Hydraulic torque wrenches**

These hydraulic wrenches in different sizes are of the bush and nut pass through type with square drive control unit for clamping with four wrenches at the same time.

■ **20 Battery-operated electric torque wrenches**

Of the gun type, these wrenches will be used as an alternative to pneumatic wrenches for torque-controlled reassembly of flanged joints in general and for the maintenance of air-coolers with plugged heads; these tools will also allow a reduction in noise pollution as well as a significant decrease in the daily exposure of workers to the risk of hand-arm vibrations.

■ **CERTIFICATONS**

All our mechanical staff is certified according to the certification BS EN 1591-4 (bolt tensioning). One of our engineers who achieved the certification according to BS EN 1591, has become the bolt tensioning manager, training all our staff dealing with bolt tensioning, according to the regulation.

Regarding piping activities, given their level of criticality during the turnaround, a series of investment have been made, in order to reduce the working time and to increase the quality standards:

- Implementation of welding systems by purchasing 03 state-of-art autonomous units of orbital welding, produced in the USA, characterized by a low footprint on the circumference of use; such tools, with application field from 8", will be used to sensibly decrease the welding times and to reduce the risk of repair on the welded joints.
- Purchase of hydraulic couplers to improve coupling on the joints to weld.
- Purchase of hydraulic flange spreaders to reduce opening times and avoid damaging on the flanges.
- Purchase of increasingly high-performing hydraulic nut splitters and a new type of air saws, reducing response timelines and explosion risks associated with traditional systems.

We are convinced that the survival of a company in such a 'liquid' and ever-changing market, strongly depends on its ability to innovate and renovate again and again. We are so this with enthusiasm and dedication and the results confirm that we are on the right track.

MAIN TURNAROUND WORKS

Our company boasts solid experience in extraordinary maintenance on major petrol and petrochemical plants both in Italy and abroad.

MAIN TURNAROUND WORKS

HOW TO HAVE A SUCCESSFUL TURNAROUND

Our Company has a great experience in the execution of Turnarounds, so we summarize here below our past experiences and the success factors and the problems that we face in Turnarounds.

SUCCESS FACTORS

1. Good preparation (Company / Client): a very good preparation phase, with the right timing, with the right team from Contractor and Client side, with the right experience on the field, is the fundamental key factor
2. Create a solid Contractor + Refinery team with a real win / win vision: honesty, open-mindedness, common objectives between Contractor and Refinery
3. Put in place a "Realistic planning": it is clear that shorter deadlines imply a significant reduction in costs, but no planning can be carried out without being feasible, realistic and safe ("real" safety cannot be separated by realistic milestones)
4. Preparation: do not focus only on Contractor. Preparation times with Contractors are always longer and that is a good thing in theory. But sometime during the preparation the Refineries are more and more "concentrated" on the Contractors and little on themselves, and their capacity in terms of men (number and experience), means and internal organization capable of respecting the often very challenging TAR objectives.

PROBLEMS... AVOID THE USUAL "BOTTLENECK" DURING TAR:

5. Work permits: Are there enough people from the Refinery to follow the permits in real time? Were they designed to be quick, clear and to avoid unnecessary bureaucracy?
6. Washing area: it is essential to have a suitable area considering the equipment to be washed, to correctly manage the washing area by avoiding the accumulation of parts to be washed and by allowing an effective entry / exit of arts to be washed
7. Inspections: The waiting times for inspections leads to huge delays. It is therefore essential to have the right number of inspectors.
8. Scaffolding: having the right number of teams involved in modifying scaffolding and well made scaffolding will produce considerable time saving and performance improvement
9. Unexpected work: How is it possible to have 1 or 2 years of preparation and then 40 to 50% of unexpected work during the shutdown phase?
10. "External" Refinery Supervisors without a complete knowledge of the site: often on the ground many Refinery Supervisors are "external" to the Refinery and so with very small knowledge of the Refinery, which doesn't help Contractors at all
11. Crane management: Crane management by Refinery with external companies can often be inefficient and cause considerable loss of time
12. Manage internal conflict (Refinery Operation / Refinery TAR team): Contractors are often between internal conflicts between Operation / TAR team of the Refinery, and therefore suffer tensions and delays due to these conflicts
13. Manage technological innovations (eg Phased Array: inspectors with the right experience): Technological progress is fundamental, but it is necessary to be certain of the real positive return from the use of these new technologies and from the preparation users of these new technologies. Often systems like email - Roser - Teams - Primavera etc. provide conflicting information or, above all, it is not clear which is the "master" source for the information
14. It is not possible to manage Companies without a Contract: if the mechanical Contractor is responsible for managing other contractors (such as lifting, scaffolding, insulation, painting), for this management to be "real" and effective it is necessary that between the contractor and these companies have a contractual relationship, otherwise only confusion and low efficiency will arise
15. Active Supervisors are needed and not just "Arbiters": some Refinery Supervisors are reduced to being simple "arbiters", ready to report errors / inefficiencies of the Contractor, while their fundamental purpose should be to facilitate the work and above all to prevent such errors from occurring. They should prevent rather than report the problem that has already occurred
16. Document management: before and during a TAR a huge amount of documentation is produced (technical specifications, statement of works etc.). Ineffective document management causes waste of time and, above all, could cause incorrect works/installations and therefore produce real dangers for people and systems. Some examples of incorrect document management are the circulation of documents with incorrect revisions, the total lack of specifications, work instructions communicated only verbally.
17. Warehouse management of the Customer's materials: the correct and effective management of materials (including for example bolts, gaskets, blinds, etc.) is essential for the success of a TAR. The unavailability of materials, often despite a long preparation phase for the TAR, can produce delays often difficult to recover. This management could be made more efficient by hand in all the materials to be installed over to the Contractor before TAR beginning, following a validation process by Refinery and Contractor.

For ENI Livorno, ENI Taranto and other Italian refineries reduced/short shut down are not included.

LETTER OF REFERENCE

Safety, sustainability and attention to each aspect of our work are a real company asset.

LETTER OF REFERENCE

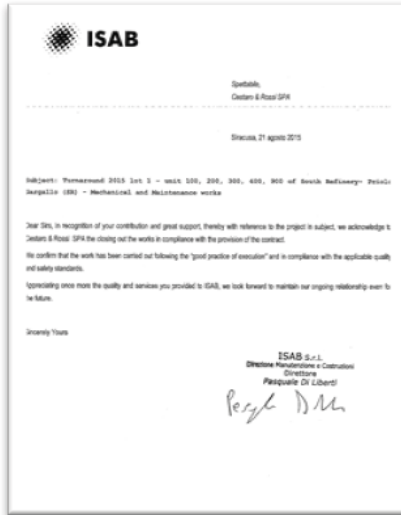

Safety, sustainability, attention to every aspect of our work are far more than a law requirement to comply with every 3-5 years. They rather represent a real company asset guaranteeing quality, cost control, company reputation improvement and faster production with the resulting customer satisfaction. The references, the awards and acknowledgments achieved in years speak for themselves.
